

Reducing Diesel Emissions

Testing, regular maintenance and retrofitting are proven factors in reducing emissions.

Retrofit your diesel with a Combustion Catalyst System (CCS) – to increase combustion efficiency thus decreasing emissions and fuel consumption.

AES Pacific Ltd can quickly install a CCS now available in New Zealand. Utilizing an airborne delivery system, a catalyst mixture is delivered into the combustion chamber to enhance the burning process. Several benefits can be realised as already demonstrated in independent and customer testing overseas and in New Zealand including:

For your diesel motor

- Combustion efficiency
- Better fuel economy and more HP
- Less soot, cleaner oil and longer engine life
- Emissions reduction

Monitoring

After retrofitting the CCS your emissions profile can be updated to show reductions!

Find out more NOW. A totally self funding contribution to reducing emissions. Something you can tell others that you are doing as a positive contribution.
